

ACT 1 — THE GATE (Loading Screen) *Camera:* Static. Fullscreen 2D overlay. No 3D scene yet. *Scene:* Pure black void (#000000). A CRT monitor centered in frame — bulky 1980s TV set, dark grey housing, rounded edges, floating in nothing. *CRT Screen content:* - Thick chunky loading bar (pixel-art style, visible segments) - Above the bar: 3D frog rotating slowly in space — stylized, green-brown swamp colors, subtle breathing animation - Below the bar: terminal text types out line by line:

copy

```
> INITIALIZING ANURA SYSTEMS...
> BIOSENSORS ONLINE...
> SWAMP_VOLUME DETECTED...
> LANDING SEQUENCE ARMED...
> GATE OPEN
```

- Percentage counter (tabular nums, monospace) *Loading behavior:* ~7 seconds. Glitchy/uneven — fast to 34%, pause, crawl to 42%, burst to 75%, freeze at 88%, final push to 100%. *At 100%:* The CRT screen brightens. The image on the screen starts to stretch and warp — the screen is pulling us IN. The edges of the CRT bend outward like a tunnel. We're being sucked into the monitor. *Transition:* The CRT screen fills our entire view. For a brief moment we're inside the low-res CRT image — then the image sharpens, resolution climbs, and we emerge into the 3D world. The quality jump is dramatic: from fuzzy CRT phosphor to a rich, detailed 3D environment. Like going from a 1998 PS1 cutscene into a 2007 GTA IV game. *Audio:* CRT power-on hum. Coil whine. Relay click. Then a deep bass drop as we're pulled through the screen. —

ACT 2 — THE FALL *Camera:* Follows frog from above → transitions to first-person falling. *Scene:* We emerge from the CRT into the sky. Heavy mist/clouds. Dark blue-grey atmosphere. No ground visible yet. *The frog:* Tumbling through the air, limbs flailing. Same 3D frog from loading screen. *Camera behavior:* Third-person (behind and above) → transitions to first-person. We fall together with the frog below us. *Environment during fall:* - Thick mist layers we punch through - Sound: falling flute tone — air rushing, soft melodic wind - Occasional glimpses of canopy far below — and through the mist, far below, a warm amber glow. That's the campfire. That's where we're going. *Landing:* Frog lands first — splash in mud. Camera lands just after — soft thud, stabilizes at ground level. *Transition:* We're in the forest. Act 3 begins. —

ACT 3 — THE SWAMP DRIFT *Camera:* First-person. Ground level. Slow smooth drift, like floating. *Scene:* A dark green forest. Not dead — alive. Lush. Dark green leaves, moss-covered trunks, ferns, vines. The forest floor is moist mud with patches of grass and small puddles. But it's on the verge of creepy — the trees are slightly too dense, the mist is thick, the shadows move in peripheral vision. You feel watched but not threatened. It's alive and it knows you're here. *Lighting:* Dim. Shafts of pale moonlight cut through gaps in the canopy. Bioluminescent hints — faint green/blue glows on mushrooms, moss, fireflies. The forest has its own subtle light. *In the distance, ahead:* A warm amber glow. Flickering. The campfire from Act 4. It's visible through the trees — a beacon. That's where we're drifting toward. The glow gets slowly brighter as we move forward. *The frog:* Right in front of us. Shakes off landing, looks around, spots the glow ahead, starts hopping toward it. *Camera behavior:* Follows frog automatically along a narrow muddy trail. Smooth, not jarring. The frog is leading us to the light. *The path:* - Narrow muddy trail winding through dense green trees - Puddles reflecting the dim sky and the distant amber glow - Fallen logs covered in moss, rocks with lichen, tufts of ferns - Mist parts as we move — it's thick but not impenetrable - Occasional fireflies drifting past the camera - The amber glow ahead gets progressively brighter (1/2)

First text trigger: As we begin drifting, text fades in smoothly — lower third of screen, elegant, minimal. Appears word by word as we move forward. First piece of copy about what ANURA does. *The turn:* Path curves right → fast sharp left turn → camera swings around corner → trees part — the amber light floods in — we see the clearing ahead. *Transition:* We enter the clearing. Act 4 begins. —

ACT 4 — THE CLEARING (Sanctuary) *Camera:* First-person. Slow orbit/pan entering the clearing. *Scene:* A small forest clearing. The same dark green forest surrounds it but here the canopy opens up. Flat mud with grass patches. The creepy tension of Act 3 melts away — this is the sanctuary. *In the clearing, left to right:* 1. **Dark red tent** — weathered camping tent, maroon fabric, open flap, cozy sleeping bag inside, warm amber light spilling out 2. **Campfire** — center, crackling, amber/orange light casting dynamic shadows on surrounding trees, sparks drifting up, primary light source, the glow we saw from Act 3 3. **Yeri** — 3D character sitting on a log by the fire. Stylized, not hyper-realistic. GTA IV-era quality — ~30,000 polygons per character, detailed enough to feel real, not modern PBR. Looking into the flames. Firelight illuminating face. Calm. Been waiting. *The frog:* Hops past screen right to left, casual, disappears into trees. Job done. *Sky:* Through the canopy gap — dark night sky, deep blue-black, scattered stars, large gibbous moon casting soft silver light mixing with the fire's amber glow. *Atmosphere:* Warmth. Safety. The forest is still dark and alive around us but here, in this circle of firelight, you're okay. *Text triggers:* More text appears as camera pans — tent, fire, Yeri. Each piece fades in smooth, movement-triggered. Copy about ANURA's positioning, philosophy, what they build. *The CTA:* Above the campfire, floating gently — appears after a moment: **"IF YOU ARE WORTHY OF OUR PROCESS"** Pulses gently. Click triggers Application Gate. *Mood:* Arrival. You've made it. This is the heart. —

VISUAL QUALITY STANDARD (applies to all 3D acts): older counter strike game era. ~30,000 polygons per character. Not hyper-modern PBR. Not photorealistic. But modern enough to feel immersive and real. Think: detailed textures, good lighting, real-time shadows, ambient occlusion — but with a slightly stylized edge. Not CS:Source. Not PS1. That sweet spot of 2007-2010 3D games where it looked "next gen" but still had character.
